Build in APAC. Build for the world.

Participant Details

Participant name: Md. Masum Ahmed

Problem Statement: People often struggle to read and understand long documents, articles, or reports due to time constraints and information overload.

Brief about the idea

I built a text summarization tool using Generative AI that converts long pieces of text into short, clear summaries.

The goal is to help users quickly understand key information without reading the entire content.

Meeting the Build Criteria

- How did you navigate the requirements of your chosen track to build a custom solution - using ADK, MCP, or AlloyDB AI that effectively addresses the 'What You Must Build' criteria?

For this project, I used:

Agent Development Kit (ADK): to handle user input and manage the summarization process

Gemini (Generative AI): to generate accurate and meaningful summaries

The system takes raw text as input and produces a concise summary in seconds.

Opportunities

- How different is it from any of the other existing ideas?
- How will it be able to solve the problem?
- USP of the proposed solution

What makes it different?

My solution focuses on fast and easy summarization with clear, readable outputs.

How does it solve the problem?

It reduces long content into key points, saving time and effort.

USP:

A quick, reliable, and easy-to-use AI-powered summarization tool.

List of features offered by the solution

- Summarizes long text instantly
- Generates clear and concise outputs
- Simple and user-friendly interface
- Saves time for users

Process flow diagram or Use-case diagram

- User submits text →
- Root agent receives input →
- `add_text_to_state` tool saves text →
- **Text Processor Agent** summarizes content →
- **Response Formatter Agent** formats summary →
- User receives final summarized output

Technologies to be used in the solution

Generative AI Model: Gemini

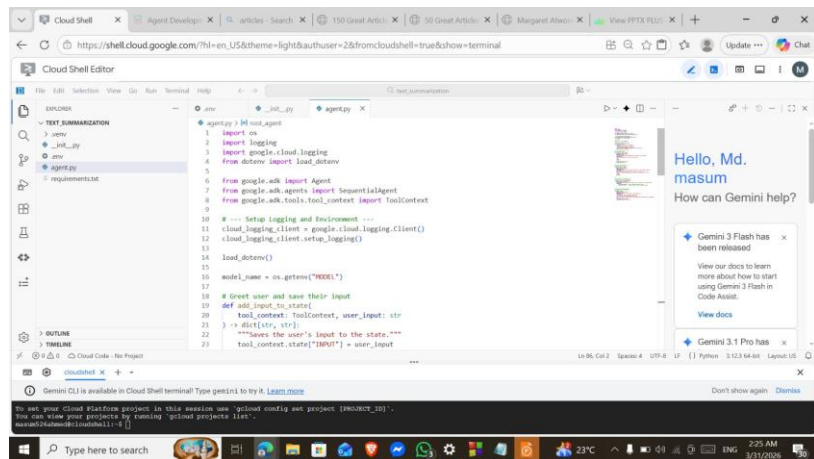

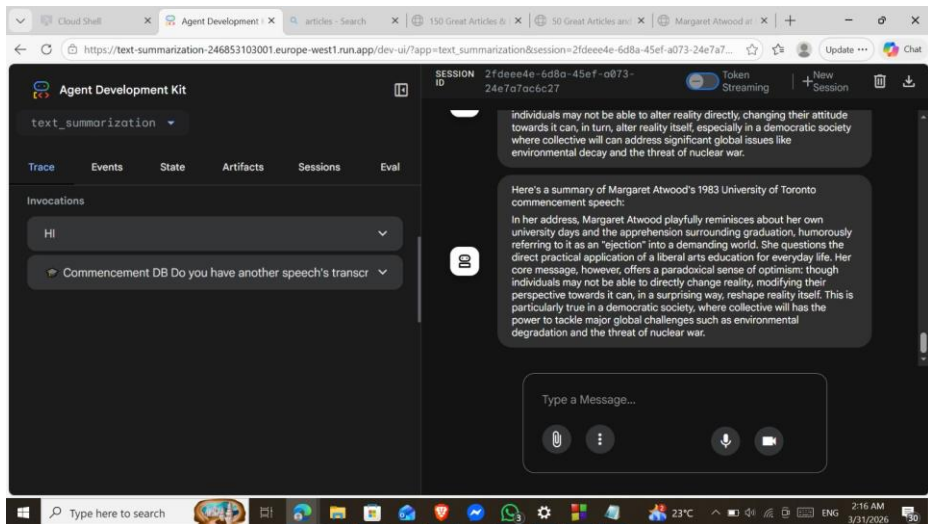

Agent Development: Agent Development Kit (ADK)

Deployment: Cloud Run

Supporting Languages & Frameworks: Python, dotenv, google-cloud-logging

Additional Tools: Cloud Shell, logging client for observability
